Earth is both universal and unique. During the era of **Geo Centric Universe**, since before the birth of prophet Jesus, Earth was believed to be the center of the universe, therefore was very unique. This universe model survived until Nicolaus Copernicus published an alternative universe model called **Helio Centric Universe** in 1543, where the Sun was considered the center of the universe. This universe model was modernized to explain that the Sun is the center of the Solar System and there are other planetary systems with a star or stars (binary or triple stars) at their center. This modern universe model explains that Earth is universal because there can be other planets like Earth in other planetary systems. However, Earth is unique too because Earth was chosen by God among all the planets in the universe to accommodate human beings. Billions of years of evolution of the Solar System have prepared Earth to be a perfect human colony in the universe. The Sun is a relatively small star but producing a suitable form and amount of energy for life. The Earth is positioned at a perfect distance from the Sun to receive the right amount of light from the Sun so that enough liquid water in the form of oceans and seas may exist on Earth for the emergence and evolution of life on Earth. The moon with a perfect comparative size to Earth was positioned at a perfect distance from Earth to enable the ocean tides for the synthesis of biological molecules along the tidal zones. The molecules developed into simple life which later further developed and initiated the development of more complex life forms. These organisms together with geological activities on Earth, developed ecosystems providing the right composition of atmosphere made possible by the gravity for more complex floras and faunas to emerge and develop on Earth and prepared Earth for human beings. All these evolutions for billion of years on Earth are protected from destructive asteroids and comets not only by the atmosphere, but also by other planets in the Solar System, particularly the massive giant gaseous planets of Jupiter and Saturn. Mercury, Venus and Mars were the smaller rocky planets in the vicinity of Earth to provide gravitational equilibrium to Earth while orbiting the Sun. Uranus and Neptune migrated to the outermost region of the Solar System to provide space for Jupiter and Saturn to be nearer Earth. Earth is made unique by the evolution of the Solar System. Earth is universal astronomically, but unique biologically and theologically. Astronomically there are other planets like Earth in other planetary systems, but biologically and theologically there is no other planet like Earth in the universe. This new universe model is called **God Centric Universe**. *God Centric Universe was registered with MyIPO on 2 January 2025 (CRLY2025W00010).*
